

Experience Game Board

Reset & Setup Instructions

Walkthrough recorded 22 June 2026 · Wojciech Szloch & Aiswarya S

This document covers the end-to-end procedure for resetting a Game Board before or between events, checking instance inventory, configuring the leaderboard, and setting up Infinity Studio GitHub Copilot credentials. Follow each section in order when preparing for a new event.

#	Section
1	Understanding the Demo Table & Scope Sets
2	Checking Instance Inventory
3	Running the Cleanup (Reset) Case
4	Leaderboard Configuration (config.js)
5	Infinity Studio – Copilot Account Mapping
6	Pre-Event Checklist
7	Credentials Quick Reference

1 · Understanding the Demo Table & Scope Sets

The **Demo Table** in the Game Board lists all available demos. By default, running the board without parameters shows all six demos. You can restrict visibility using a **scope** parameter that maps to a label (called a set) stored in **Demo Properties** → **Demo Features**.

Defined sets

Set	Demos included	Typical use
set1	Back Office, Customer Service, Infinity Studio	Events showing these three experiences
set2	Single demo (e.g. Blueprint)	Focused single-experience events
(none)	All six demos	Full demo catalogue — default view

How to filter by set

1	Open the Game Board Navigate to the Game Board URL for the event (e.g. Gameboard 1, 2, or 3).
2	Run without parameters You will see <i>all six demos</i> listed in the carousel.
3	Apply a scope filter Append ?scope=set1 (or set2) to the URL, or pass the scope parameter in the run configuration. Only the demos tagged with that label will appear.
4	Export before modifying Before removing demos from the Demo Table for a specific event, use the Export function to save the full table. Re-import after the event to restore all six demos.

■ Note: The **Blueprint** demo is not visible when using sets NBA and Agentic. Keep this in mind when choosing which set to activate.

2 · Checking Instance Inventory

The **Check Inventory** case verifies that every Pega instance listed in the **Instance Table** is reachable and pointing to the correct Game Board URL via the Feedback Service application setting. Run this any time before an event.

1	Open the Game Board admin panel Log in with admin operator credentials (see Section 7).
2	Navigate to Check Inventory Click the Check Inventory case in the left navigation.
3	Review the results Each instance row shows: connectivity status, the Feedback Service URL it is configured with, and whether that URL matches the current Game Board. A green/connected status means the instance is up and correctly configured.
4	Fix misconfigured instances (optional) If an instance shows the wrong Feedback Service URL, tick the Configure Automatically checkbox and click Submit . The system will push the correct Game Board URL to every instance in the table. This is safe to run multiple times.
5	Add a new instance Add its hostname/URL row to the Instance Table, then re-run Check Inventory. Tick Configure Automatically to have the URL pushed automatically.

■ Scope: Check Inventory only validates instances that are explicitly listed in the Instance Table. There may be other instances pointing to this Game Board that are not shown here — but they are unlikely to cause issues because there will be no matching game/operator object for them.

3 · Running the Cleanup (Reset) Case

The **Cleanup** case wipes all game results, scores, and player records from the Game Board database, returning it to a clean state. Run this before every new event.

1	Open the Game Portal Navigate to the Game Portal page to see the current statistics (players, scores, records).
2	Navigate to the Cleanup case In the admin panel, open the Cleanup case.
3	Select all records Check all checkboxes to select every result set you want to remove.
4	Submit Click Submit . The system will process the deletions. You may see a transient error message even on success — this is a known UI quirk.
5	Verify Refresh the Game Portal. All statistics (players, records, scores) should show zero . If values remain, wait a moment and refresh again, or re-run the cleanup.
6	Repeat for each Game Board If running multiple Game Boards (GB1, GB2, GB3), repeat these steps on each one using the same procedure.

■ **Warning:** This action is **irreversible**. Ensure you have exported any data you need to retain before running Cleanup.

4 · Leaderboard Configuration (config.js)

The leaderboard display is controlled by **6GXP / Scripts / config.js** in the file system. Edit this file to control which tabs, scores, and logos appear.

Key configuration flags

Flag	Values	Effect
showGames	true / false	Shows individual per-game tabs on the leaderboard. Tabs are generated for every demo
showTeamScores	true / false	Displays the team score tab.
showPartnerScores	true / false	Displays partner organisation scores. Requires the 'partner' flag to be set on the relevant
showOrganizationLogos	true / false (default: false)	Displays organisation logos next to team names. When false, a formatted square with th

Restricting game tabs to event demos only

1	Export the full Demo Table Before making changes, export the Demo Table so you can restore it after the event.
2	Remove non-event demos Delete the rows for demos not being shown at this event from the Demo Table.
3	Set showGames = true in config.js The leaderboard will now show only tabs for the remaining demos.
4	Restore after the event Re-import the previously exported Demo Table to restore all six demo entries.

5 · Infinity Studio – Copilot Account Mapping

Infinity Studio creates a new player operator by *cloning* one of up to three **template operators** (Do Not Delete Me 1/2/3). Each template operator has a GitHub Copilot account pre-signed in. The cloned player operator inherits that Copilot session — players do **not** need to sign in themselves.

DSS settings that control the loop

DSS key	Values	Effect
enableModelLoop	true	Cycles through model operators 1, 2, 3 in order for each new player created.
enableModelLoop	false	Always uses the single operator specified in modelLoopID.
modelLoopID	1 / 2 / 3	When loop is disabled, this is the only template operator used.

Instance configuration

Instances	Loop setting	Template operators
Infinity Studio 1 & 2	Enabled (3 accounts)	Do Not Delete Me 1, 2, 3 — three different GitHub accounts
Infinity Studio 3 & 4	Disabled (1 account)	Single template operator only

How to sign in / re-sign in a GitHub Copilot account

1	Check token usage In the GitHub account, go to Settings → Copilot → Usage . If consumption is near the limit, replace the account before the event.
2	Log in to the Infinity Studio instance Use operator: do-not-delete-me-1 (or 2/3), password: install12345!
3	Navigate to the Copilot sign-in page Find the Copilot settings page inside the instance. Copy the sign-in URL.
4	Sign in with the GitHub account Use SSO via the enterprise GitHub account. This requires VPN — complete this step before arriving at the event venue.
5	Verify connection Return to the Copilot status page and confirm the status shows Connected .
6	Repeat for each template operator If using three accounts (loop enabled), repeat for Do Not Delete Me 2 and 3.

■ **VPN required:** The GitHub enterprise SSO page is not accessible without Pega VPN. Complete all Copilot sign-in steps before travelling to the event venue.

■ The Reset Infinity Studio activity runs automatically each time a player starts the experience (when Start Game is clicked). It handles branch deletion and user story pre-population. You do not need to trigger it manually.

6 · Pre-Event Checklist

Complete each item below before doors open. Tick off in order.

Game Board setup

- Export the full Demo Table (backup).
- Remove demos not being shown; set the correct scope set.
- Run **Check Inventory** on all Game Boards (GB1, GB2, GB3).
- Run the **Cleanup** case on all Game Boards to zero out scores.
- Verify the Game Portal shows zero players and zero scores.

Leaderboard

- Edit **6GXP/Scripts/config.js** — set **showGames**, **showTeamScores**, **showPartnerScores**, **showOrganizationLogos** as needed.
- Mark partner organisations in the Teams Table if **showPartnerScores** is true.

Infinity Studio Copilot (requires VPN — do before travel)

- Check GitHub Copilot token usage for all three accounts.
- Re-sign in any account that is near its token limit.
- Verify each template operator shows **Connected** status.
- Confirm **enableModelLoop** and **modelLoopID** DSS settings match event scale.

Game Board 3 (if using)

- Confirm buddy-article ingestion is complete.
- Run a quick end-to-end test after ingestion.

7 · Credentials Quick Reference

The following credentials were shared during the walkthrough recording.

System / Role	Username / Operator ID	Password
Game Board – Admin Operator	admin operator	install12345!
Infinity Studio – Template Operator	d1-not-delete-me-1@n.pegas.com	install12345!
Infinity Studio – Template Operator	d2-not-delete-me-2@n.pegas.com	install12345!
Infinity Studio – Template Operator	d3-not-delete-me-3@n.pegas.com	install12345!

■ These credentials were shared in a recorded session. Rotate passwords after the event if the recording is distributed externally.
